

Slip Sweep Solutions

Input Stack

As companies strive to improve turnaround time, reduce cost, and increase the quality of their onshore seismic, compromises are made.

The use of Slip-Sweep acquisition, whereby shots occur closely timed, or 'At-Will' whenever the source is ready, allow rapid acquisition but at the expense of source contamination from nearby shots.

Corrected Stack

Seitel's proprietary deblending solution compensates for varying degrees of slip sweep contamination.

Advantages

- AVO and AVA compliant
- Effective at removing heavily contaminated datasets.
- Can be executed at various stages of processing.
- Allows acquisition to progress to generate higher fold in the same time period.
